INTERNSHIP PROCESS

Week 7 — A/B Test Proposal

Guest checkout visibility hypothesis, control/variant, metrics, and risks.

A/B Test Proposal: Guest Checkout Visibility

Hypothesis

Making the **Continue as Guest** option more visible and displaying a guest-checkout notification during checkout will reduce user confusion, improve user confidence, and increase successful guest checkout completion.

Control (Version A)

Current Design

- Continue as Guest appears below the Sign In option.
 - No guest-checkout notification is displayed.
 - Users proceed through checkout without confirmation that they are checking out as a guest.
-

Variant (Version B)

Improved Design

- Display **Continue as Guest** as the primary action.
- Show the following notification on the Shipping Address screen after the user selects Guest Checkout:

You are currently checking out as a guest. Sign in at any time to save your details.

- Increase the visibility of the Guest Checkout option.
-

Metrics

The following metrics will be used to compare Version A and Version B:

- Time taken to locate **Continue as Guest**.
 - Percentage of users selecting **Continue as Guest**.
 - Number of users asking whether sign-in is required.
 - Percentage of users who notice and understand the guest-checkout notification.
 - Task completion rate.
 - User confidence during checkout (based on participant feedback).
-

Risks

Potential risks of the new design include:

- Returning users may overlook the **Sign In** option.
- Users may ignore the guest-checkout notification.

- A more prominent Guest Checkout option may reduce account sign-ins.
 - The notification may add slight visual clutter if it is too prominent.
-

Expected Outcome

Users should find the Guest Checkout option more easily, understand that an account is not required, and complete the checkout process with greater confidence and less confusion.
